Education & Income Analysis

1994 U.S. Census Data | 40-Hour Workers | Income Threshold: $50K

Key Finding
In the original analysis, individuals with post-secondary education had a 16.65-percentage-point higher rate of earning over $50K than those with a high school education or less. This reflects an observed association, not necessarily a causal relationship.

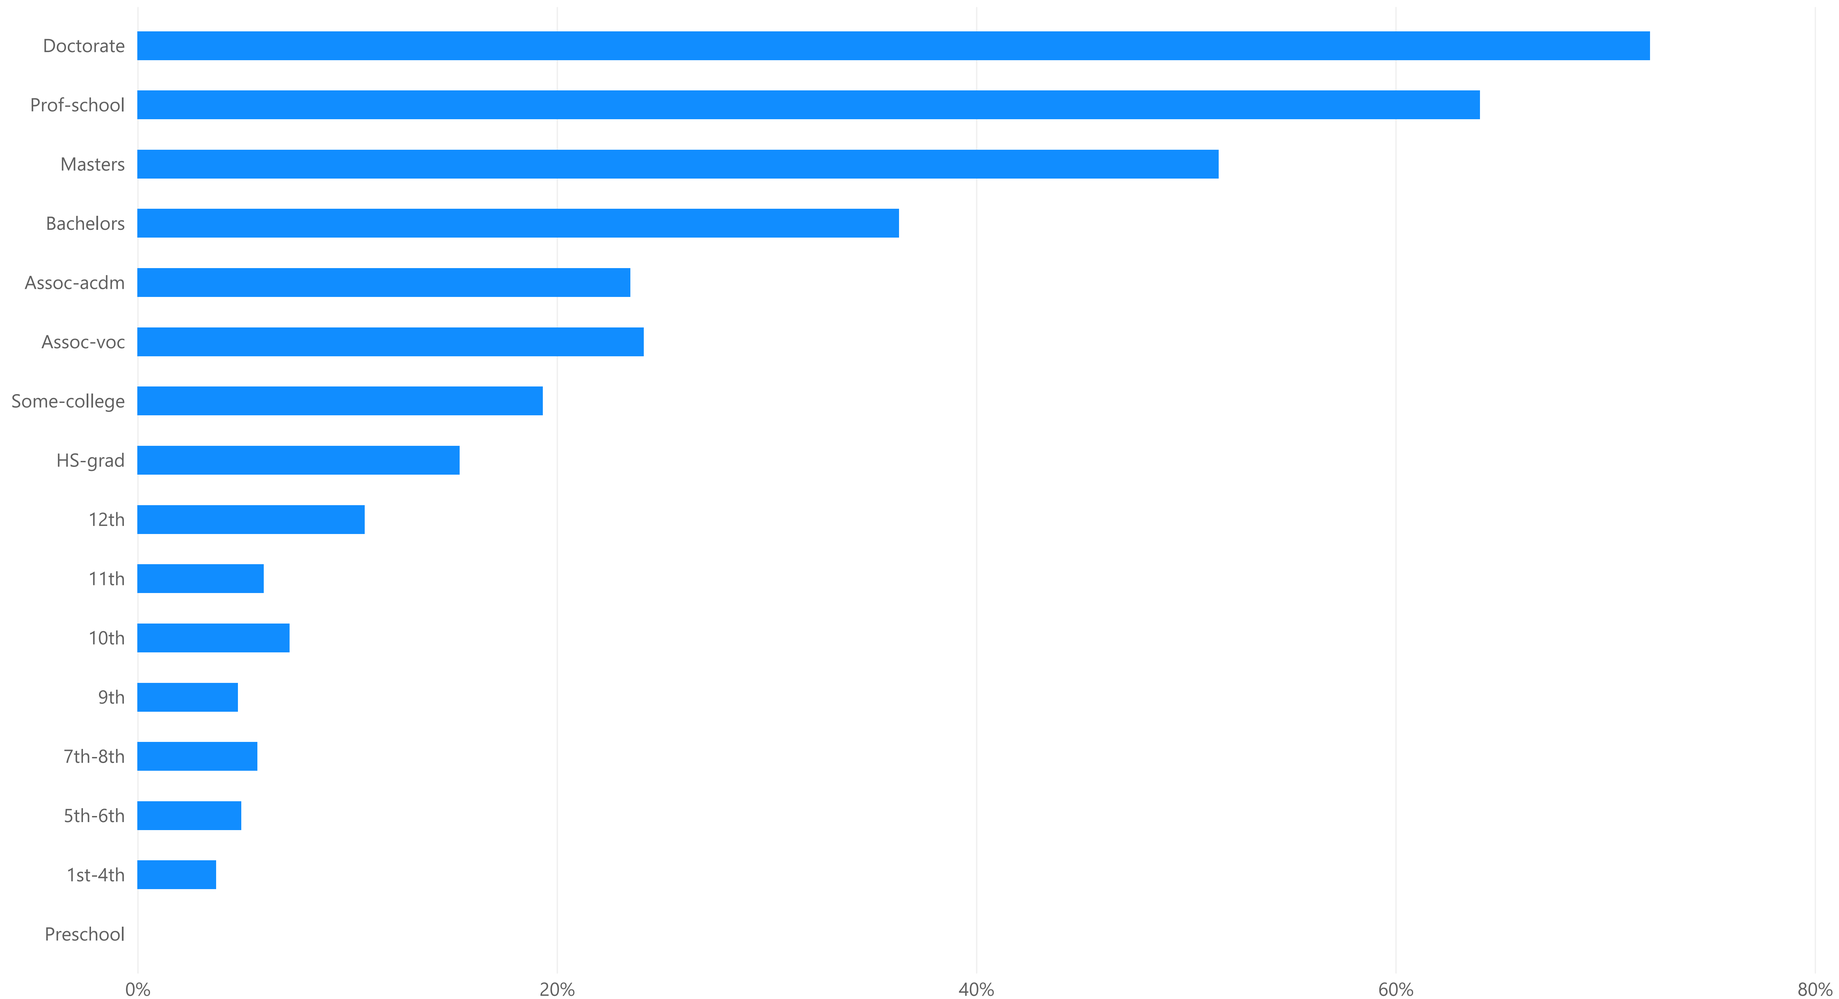

Post-secondary Rate
29.59%

Up-to-high-school Rate
12.94%

Education Gap (pp)
16.65

Key Finding

The education-related high-income-rate gap increases from 4.89 percentage points among individuals aged 17–29 to a peak of 26.66 points among those aged 50–59, before narrowing among older groups. Estimates for the oldest age groups should be interpreted cautiously because of small sample sizes.
